ACTUARIAL SURVEY OF  
CONNECTICUT STATE EMPLOYEES RETIREMENT PLAN

We are enclosing herewith for your perusal an actuarial survey of the Connecticut State Employees' Retirement Plan. Since the copies are limited, we suggest that you post the report at a convenient place where it may be made available to the employee.

Very truly yours,

State Employees' Retirement Commission

*John M. Dowe*

APR 5 1945

ACTUARIAL SURVEY OF

CONNECTICUT STATE EMPLOYEES RETIREMENT PLAN

Just before the new retirement law went into effect in 1939, the state was paying its retired employees:-

1939 . . . . . \$153,000 per year

Five years later, the payments to retired employees (including the amounts payable after termination of active service to "retired" employees who have been continued in service by reason of the war emergency) are as follows:-

Old Law . . . . . \$112,000 per year  
 New Law . . . . . 582,000 " "  
 1944 Total . . . . . \$694,000 " "

The estimates for the future, developed from past experience by methods explained in the appendix, are:-

<u>Year</u>	<u>Total Pension Payments</u>	<u>% of Estimated Payroll</u>
1949	\$1,251,000 per year	5.3%
1954	1,948,000 " "	8.0
1959	2,874,000 " "	11.6
1964	3,893,000 " "	15.7
1969	4,715,000 " "	19.2
1974	5,180,000 " "	21.2
1979	5,348,000 " "	21.9

It will be impossible to get anything like one-half of the above payments from employee contributions, as seems to have been contemplated by the framers of the Law, even if the rate of employee contribution is immediately raised from the minimum of 2½% of earnings to the present statutory maximum of 5%. At this rate of contribution the Retirement Fund accumulated out of employee contributions will continue for several years both to grow and to provide half the pensions, as it has done in the past. However, within an estimated 18 years from now, the Retirement Fund will not only stop growing but even become completely exhausted. After that time there will be no Retirement Fund to represent past contributions of the then active employees, and the state will consequently have to pay the major share of the pensions. See Table 1.

*Wms. Curd*

TABLE 1

(1) <u>Period</u>	(2) <u>5 Years' Estimated Pensions</u> †	(3) <u>5 Years' Estimated Contribu- tions at 5%* of Salaries</u>	(4) <u>Estimated Interest Earnings at 2½% per Annum</u>	(5) <u>5 Years' Estimated Refunds on Withdrawal or Death</u>	(6) <u>Part of Pensions Paid from Retirement Fund</u>	(7) <u>Estimated Retirement Fund at End of Period</u>	(8) <u>Net Cost to State †</u>	(9) <u>Cost to State as Percent of Payroll</u>
1939-44	\$1,292,000	\$2,350,000	\$ 92,000	\$ 336,000	\$ 646,000	\$1,460,000	\$ 646,000	.7%
1944-49	4,410,000	5,284,000	324,000	1,113,000	2,205,000	3,750,000	2,205,000	1.9
1949-54	7,745,000	5,982,000	519,000	1,815,000	3,873,000	4,563,000	3,872,000	3.2
1954-59	11,943,000	6,141,000	472,000	2,222,000	5,971,000	2,983,000	5,972,000	4.9
1959-64	16,888,000	6,198,000	150,000	2,418,000	6,913,000	None	9,975,000	8.1
1964-69	21,520,000	6,165,000	None	2,508,000	3,657,000	None	17,863,000	14.5
1969-74	24,738,000	6,118,000	None	2,535,000	3,583,000	None	21,155,000	17.3
1974-79	26,320,000	6,100,000	None	2,545,000	3,555,000	None	22,765,000	18.7

† Excluding amounts payable under Old Law in effect prior to 1939.

\* 2½% for 1939-44 period and for the first year of the 1944-49 period.

† This cost is divided between the Highway Fund and the General Fund.

Ultimately, it is estimated, each year's employee contributions will be about \$1,200,000, of which about \$500,000 will be used to pay refunds of past years' contributions to employees currently dying or terminating employment, leaving \$700,000 to apply against pensions of about \$5,200,000--that would make the state's share about \$4,500,000 per year.

It must be borne in mind in reading this report that the long-distance estimates we have made are based on many assumptions that may prove to be unreliable. The figures developed by actual events may be much different from the figures herein estimated. Our estimates have, to the maximum extent possible, been based upon the actual results of the 5-year period from late 1939 to late 1944. In particular we have used the actual survival ratios developed by the 1939 to 1944 experience. There is much reason to anticipate that, in the future, rates of withdrawal from employment before pension age will be lower than in the past five years. If this turns out to be so, future amounts of pension, and future costs to the state, may turn out to be substantially higher than the forecasts in this report. Similar comments might be made on our assumptions as to the age distributions of new employees hired, future average salaries (particularly if the country experiences a degree of inflation), mortality rates among pensioners, et cetera.

#### Change in Employee Contribution Rate

The statute provides that not more than one-half of the pensions shall be paid from the fund created by the employees' contributions. One-half of the pensions granted under the new law has been paid out of that fund. There is a provision that pensions granted under the old law shall not be paid from the new retirement fund.

The present statute requires employees to contribute at the rate of  $2\frac{1}{2}\%$  of salaries for the six years commencing September 1, 1939. Thereafter the rate is to be based "on the actuarial anticipated cost averaged yearly for a period of ten years, with a restudy to be made each six years", subject to a maximum rate of 5%.

It is our opinion that the foregoing provisions require the increase of the employee contribution rate to 4%, effective September 1, 1945. This opinion is based on the following actuarial estimate:-

Estimated pension payments for ten years beginning September 1, 1945	\$13,490,000	
One-half thereof to be paid from employee contributions		\$6,745,000
Estimated employee contributions at 4% of salaries for ten-year period	9,483,000	
Estimated contribution refunds for employees leaving service or dying during ten-year period	<u>2,713,000</u>	
Contribution collections available for application against pensions		\$6,770,000

Respectfully submitted, this 31st day of March, 1945.

## A P P E N D I X

### 1. Employee Distributions.

Table 2 shows the 1944 distribution of active employees (excluding "retired" employees continued in active service by reason of the war emergency) by five-year age groups and year-hired groups. Tables 3 through 9 show how it is estimated this distribution will look in 1949, and each five years to 1979. These tables were computed successively from the next preceding table, starting from table 2, by the use of the assumptions stated in the next three sections of this appendix.

### 2. Survival Ratios.

To determine how many in any particular age group and year-hired group will neither die nor leave service, nor be retired for disability, within the next 5 years, we need a "survival ratio". These ratios were determined by comparing the 1939 employee distribution with the 1944 distribution of the survivors of the 1939 employees, after excluding those who had died, left service, or retired for disability. These ratios are shown in table 10.

### 3. Retirement Rates.

In developing tables 3 through 9, it was assumed that all employees reaching the mandatory retirement age would retire immediately. It was assumed that of employees eligible for service retirement the following percentages of the employees who were active five years ago and are still alive now, will have by now retired.

<u>Ages</u>	<u>Lengths of Service</u>	<u>Percent Retired</u>
55 - 59 if male	25 or over	25%
60 - 64 if male	25 or over	50
65 - 69 if male	25 or over	75
50 - 54 if female	25 or over	25
55 - 59 if female	25 or over	50
60 - 64 if female	25 or over	75

### 4. New Employees Hired.

In 1944 there were 6274 male employees and 4103 female employees in active service not yet eligible to retire on pension. It was assumed that these numbers would be constant in the future. After applying the survival ratios and retirement ratios described above to one employee distribution to obtain the distribution five years later, the numbers of male and female employees were brought up to the foregoing totals by adding in just enough new employees to accomplish this result. The distribution of these new employees (in the 0-5 years of service groups) in each age group was assumed to be the same as in the 1939 distribution (in the 0-5 years of service groups). See table 11.

5. Average Salaries.

It has been assumed that the pattern of average salaries according to age, length of employment, and sex, will remain about the same as in 1944. The averages, taken to the nearest hundred dollars, and smoothed slightly to avoid assuming that the salaries of any group of employees will decrease with increased duration of employment, are shown in table 12.

6. Disability Pensions.

So far about 24 men and 12 women have been granted disability pensions each year and it is assumed that approximately these rates will continue indefinitely. The death rates among disability pensioners have averaged about 8.6% per year in the case of men, and 4.7% per year in the case of women; it is assumed that these rates will apply up to the ages at which regular pensioners' mortality rates become higher. Table 13 shows the resulting estimated distributions of disability pensions each five years from 1944 to 1979.

7. Service and Mandatory Pensions.

The numbers of new pensioners come from the development of tables 3 through 9. The amounts of the pensions are determined from the percentage rules in the present law. Survival ratios for pensioners are based upon the 1937 Standard Annuity Table, modified in the case of male employees by rating ages up 2 years--these mortality assumptions would have produced 54.5 expected deaths during the 1939-44 period as compared with 55 actual deaths among service and mandatory pensioners. Table 14 shows the resulting assumed distributions of service and mandatory pensions each five years from 1944 to 1979.
