The Retirement Board Police Retirement System of Kansas City, Missouri

Dear Board Members:

Submitted in this report are the results of the Annual Actuarial Valuation of the assets, actuarial values, and contribution requirements associated with benefits provided by the Civilian Employees' Retirement System of the Police Department of Kansas City, Missouri.

The date of the valuation was April 30, 2002.

Valuation results, comments and conclusions are contained in Section A.

The valuation was based upon information concerning Retirement System benefits, financial transactions, and individual members, terminated members, retirants and beneficiaries. Data was checked for year-to-year consistency but was not otherwise audited by us. This information is summarized in Section B.

Descriptions of the actuarial cost methods and actuarial assumptions are contained in Section C, along with a glossary of technical terms.

This report has been prepared by actuaries who have substantial experience valuing public employee retirement systems. To the best of our knowledge this report is complete and accurate and was made in accordance with standards of practice promulgated by the Actuarial Standards Board of the American Academy of Actuaries. The actuarial assumptions used for the valuation produce results which we believe are reasonable.

Respectfully submitted,

Brian B. Murphy, F.S.A.

Mita D. Drazilov, A.S.A.

MDD:kmg

Valuation Results, Comments, Recommendations, and Conclusions

FINANCIAL OBJECTIVE

The financial objective of the Retirement System is to establish and receive contributions, expressed as percents of active member payroll, which will remain approximately level from year-to-year and will not have to be increased for future generations of citizens.

CONTRIBUTION RATES

The Retirement System is supported by member contributions, City contributions and investment income from Retirement System assets.

Contributions which satisfy the financial objective are determined by an annual actuarial valuation and are sufficient to:

- (1) cover the actuarial present value of benefits assigned to the current year by the actuarial cost methods described in Section C (the normal cost); and
- (2) amortize over a period of future years the actuarial present value of benefits not covered by valuation assets and anticipated future normal costs (unfunded actuarial accrued liability).

Contribution requirements for the fiscal year beginning May 1, 2002 are shown on page A-2.

CONTRIBUTIONS COMPUTED TO MEET THE FINANCIAL OBJECTIVE OF THE RETIREMENT SYSTEM FOR THE FISCAL YEAR BEGINNING MAY 1, 2002

	Contributions Expressed
Contributions for	as Percents of Payroll
Normal Cost	
Age & service benefits	8.60 %
Death and disability benefits	0.77
Termination benefits	
Deferred age & service benefits	1.97
Refunds of member contributions	0.30
Supplemental retirement benefit	0.67
Assumed rate for administrative expenses	0.40
Total Normal Cost	12.71
Amortization Payment	
Scheduled amortization of UAAL*	0.41
Additional amortization of UAAL	(0.98)
Total Amortization Payment	(0.57)
Total Contribution Requirement	12.14 %
Member portion	5.00 %
City portion#	7.14 %

^{*} Unfunded Actuarial Accrued Liabilities

The annual required City contribution is 8.12% of pay -- greater than the scheduled amount shown above. Please refer to Comment A on page A-9.

Unfunded actuarial accrued liabilities were amortized as a level percent of active member payroll. A description of the method may be found on page C-1.

Procedures for determining dollar contribution amounts are described on page A-3.

Comparative contribution amounts for prior fiscal years are shown on page A-5.

[#] It was reported that the City is contributing 7.14% for the fiscal year beginning May 1, 2002.

DETERMINING DOLLAR CONTRIBUTIONS

For any period of time, the percent-of-payroll contribution rate needs to be converted to dollar amounts. We recommend one of the following procedures.

- (1) Contribute dollar amounts at the end of each payroll period which are equal to the City's percent-of-payroll contribution requirement shown on page A-2, multiplied by the covered active member payroll for the period. Adjustments should be made as necessary to exclude items of pay that are not covered compensation for Retirement System benefits and to include special payments that are covered compensation.
- (2) Contribute \$1,548,594 on October 30, 2002. This dollar amount was derived by multiplying the percent-of-payroll contribution requirement by the April 30, 2002 valuation payroll, projected to the fiscal year beginning May 1, 2002, using a 1.045 projection factor. If contributions are made on a later schedule, interest should be added at the rate of 0.65% per month.

These two methods are essentially equivalent, and will produce the same result in the long term.

AMORTIZATION SCHEDULE FOR THE UNFUNDED ACCRUED LIABILITY

ACTUARIAL ACCRUED LIABILITIES & VALUATION ASSETS COMPARATIVE STATEMENT

Valuation Date April 30	Actuarial Accrued Liability (AAL)	Valuation Assets	Unfunded ctuarial Accrued iability (UAAL)	Ratio of Present Assets to AAL	Ratio of UAAL to Annual Payroll
1997	\$ 39,525,068	\$ 37,079,924	\$ 2,445,144	93.8 %	17.0 %
1998	43,200,513	41,835,057	1,365,456	96.8	8.9
1999	48,627,168	47,593,329	1,033,839	97.9	6.7
2000	56,038,915	56,905,524	(866,609)	101.5	(5.0)
2001	62,097,908	61,895,208	202,700	99.7	1.1
2002	67,814,254	66,401,308	1,412,946	97.9	6.8

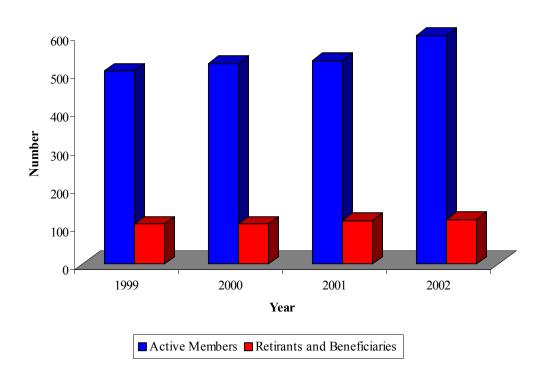

The Ratio of Valuation Assets to AAL is a traditional measure of a system's funding progress. Except in years when the system is amended or actuarial assumptions are revised, this ratio can be expected to move gradually toward 100%.

The Ratio of UAAL to Valuation Payroll is another relative index of condition. Actuarial unfunded liabilities represent debt, while active member payroll represents the system's capacity to collect contributions to pay toward debt. The lower the ratio, the greater the financial strength - and vice-versa.

Active and Retired Members

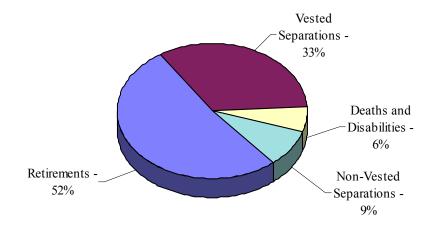

Benefits as a Percent of Payroll

Closed Group Population Projection

Expected Terminations from Active Employment for Current Active Members

Comment A: For the fiscal year ending April 30, 2003, it was reported to the actuary that the City is contributing 7.14% of payroll. Based on the results of this valuation and the current procedure of amortizing the unfunded actuarial accrued liability, the computed contribution rate is 8.12% of pay. Following the experience study, a decision will be needed regarding future contribution rates.

Comment B: As of April 30, 2002, actuarial accrued liabilities were \$67,814,254 while valuation assets were \$66,401,308, resulting in a funded ratio of 97.9%. This represents a strong financial position.

Comment C: Based on the funding value of assets the System realized a 6.7% return for the year ended April 30, 2002. Based on a market value basis, the System earned a (2.5)% return. Investment losses are currently scheduled for valuation years 2003, 2004, and 2005. Market rates of return in excess of the actuarial assumed rate is required in these years to offset these scheduled losses.

Comment D: The System experienced an actuarial loss this year, primarily from recognized investment return. Most retirement plans have similar experienced losses. A recovery in the investment markets is important if future contribution increases are to be avoided.

Comment E: A five year experience study is scheduled to be performed following this valuation to review economic and non-economic assumptions and methodologies. The results of this study will be reviewed with the Board and will affect subsequent valuations.

DERIVATION OF ACTUARIAL GAIN (LOSS) YEAR ENDED APRIL 30, 2002

The actuarial gains or losses realized in the operation of the Retirement System provide an experience test. Actual experience will never (except by coincidence) coincide exactly with assumed experience. It is expected that gains and losses will cancel each other over a period of years, but sizable year-to-year fluctuations are common. Detail on the derivation of the actuarial gain (loss) is shown below, along with a year-by-year comparative schedule.

(1) UAAL* at start of year	\$ 202,700
(2) Normal cost from last valuation	2,372,206
(3) Actual contributions	2,423,357
(4) Interest accrual: (1) x $0.0775 + [(2) - (3)] \times 0.00$	15,709
(5) Expected UAAL before changes: (1) + (2) - (3) + (4)	167,258
(6) Change from benefit changes	none
(7) Change from revised actuarial assumptions and miscellaneous	34,845
(8) Expected UAAL after changes: (5) + (6) + (7)	202,103
(9) Actual UAAL at end of year	1,412,946
(10) Gain (loss) (8) - (9)	(1,210,843)
(11) Gain (loss) as percent of actuarial accrued liabilities at start of year (\$62,097,908)	(1.9%)

^{*} Unfunded actuarial accrued liability (UAAL).

Year Ended	Actuarial Gain (Loss)

2002	(1.9) %

Summary of Benefit Provisions and Valuation Data Submitted by the Retirement System

BRIEF SUMMARY OF BENEFIT CONDITIONS EVALUATED (APRIL 30, 2002)

Eligibility Amount

SERVICE RETIREMENT

Age 65 with 10 or more years of service.

Straight life pension equals 2.0% of Final Compensation times years of service. Final Compensation is the average annual compensation for the two years of service with the highest compensation during the 10 years preceding termination of employment. Pensions are payable monthly at one-twelfth of the annual rate.

EARLY RETIREMENT

Age 55 with 10 or more years of service, or age 60 with 5 or more years of service, or date at which attained age plus years of service equal or exceed 80.

Computed as service retirement but reduced by ½% for each month that actual retirement precedes age 60 if the member has completed at least 10 years of service. Reduced by ½% for each month that actual retirement precedes age 65 if the member has completed at least 5 years of service, but less than 10 years of service. No reduction if member's attained age plus years of service total at least 80.

DEFERRED RETIREMENT

5 or more years of creditable service.

Computed as service retirement but based upon service, Final Compensation and benefit in effect at termination. Benefit begins at early retirement age.

DEATH AFTER RETIREMENT SURVIVOR'S PENSION

Payable to a surviving spouse, if any, upon the death of a retired member who was receiving a straight life pension. Benefit is payable for life.

Married employees automatically have a reduced benefit paid with a 50% surviving spouse annuity payable after their death.

In lieu of the 50% surviving spouse death benefit, the retiring employee may elect a reduced actuarially equivalent 100% surviving spouse annuity.

Should the total amount paid to a member and surviving spouse be less than the member's accumulated contributions with interest to the date of retirement, the beneficiary shall receive an amount equal to the difference.

BRIEF SUMMARY OF BENEFIT CONDITIONS EVALUATED (CONTINUED) (APRIL 30, 2002)

Eligibility Amount

DEATH IN SERVICE SURVIVOR'S PENSION

Payable to a surviving spouse, if any, upon death of a member with at least 5 but less than 20 years of service. Benefit is payable until death.

50% of member's accrued pension. The effective date shall be the later of the first day of the month after the member's death or attainment of what would have been the member's early retirement date

Payable to a surviving spouse, if any, upon death of a member with 20 or more years of service. Benefit is payable until death.

May elect a pension determined on a 50% joint-and-survivor basis from the actuarial value of the member's accrued benefit, if larger than 50% of member's accrued pension.

NON-DUTY DISABILITY

Payable upon the total and permanent disability of a member with 10 or more years of service.

30% of Final Compensation, but in no event less than the amount the member would have been entitled to as a pension, if the member had retired on the same date with equivalent age and creditable service.

DUTY DISABILITY

Payable upon the total and permanent disability of a member as a result of performance duties with the Civilian Employees' Department. 50% of Final Compensation payable for the remainder of the member's life, or as long as the permanent disability continues. The pension may be subject to offset or reduction by amounts paid or payable under any Workers' Compensation law.

POST-RETIREMENT BENEFIT INCREASES

Any member may receive during each year, in addition to the officer's base pension, a cost of living adjustment in an amount equal to 3% of the officer's base pension. Base pension is the pension computed under the provisions of the law at the date of retirement, without regard to the cost of living adjustment. The cost of living adjustment also applies to benefits being paid to a surviving spouse. The adjustment is made effective June 1 each year.

MEMBER CONTRIBUTIONS

5% of compensation.

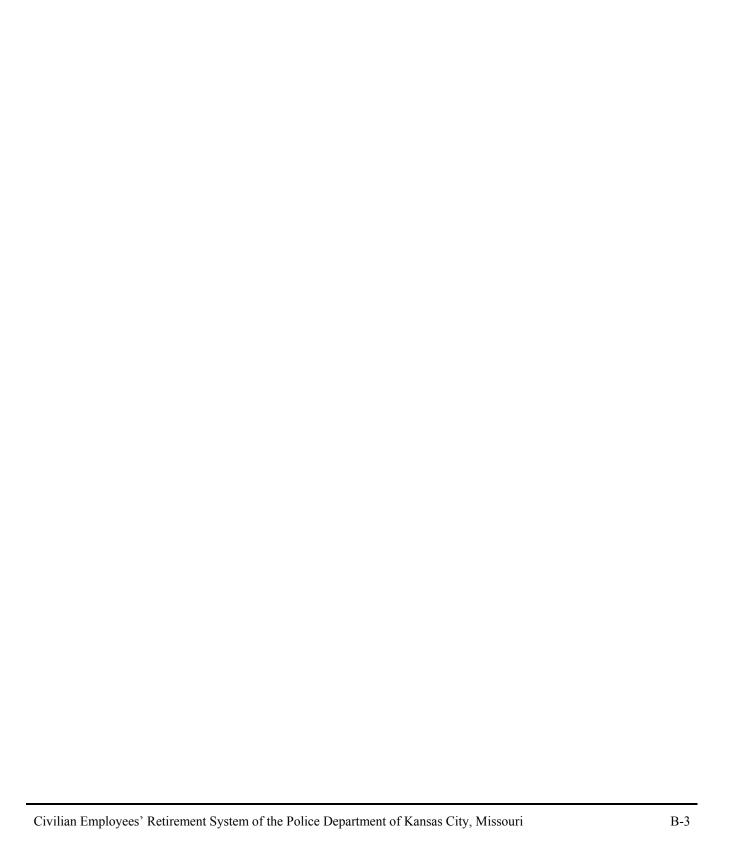

SUPPLEMENTAL RETIREMENT BENEFIT

Current and future retired and disabled members and their surviving spouses are eligible to receive \$160 per month in addition to pension benefits.

The Funding Value of Assets recognizes assumed investment return (line E3) fully each year. Differences between actual and assumed investment return (line E4) are phased in over a closed 4-year period. During periods when investment performance exceeds the assumed rate, Funding Value of Assets will tend to be less than market value. During periods when investment performance is less than the assumed rate, Funding Value of Assets will tend to be greater than market value. If assumed rates are exactly realized for 3 consecutive years, funding value will become equal to market value.

While not used in the financial computations, the following group averages are computed and shown because of their general interest.

Age: 39.8 years

Service: 9.1 years

Annual Pay: \$34,649

Financial Principles, Actuarial Valuation Process, Actuarial Cost Methods, Actuarial Assumptions and Definitions of Technical Terms

BASIC FINANCIAL PRINCIPLES AND OPERATION OF THE RETIREMENT SYSTEM

Benefit Promises Made Which Must Be Paid For. A retirement program is an orderly means of handing out, keeping track of, and financing pension promises to a group of employees. As each member of the retirement program acquires a unit of service credit the member is, in effect, handed an "IOU" which reads: "The Civilian Employees' Retirement System of the Police Department of Kansas City, Missouri promises to pay you one unit of retirement benefits, payments in cash commencing when you retire."

The principal related financial question is: When shall the money required to cover the "IOU" be contributed? This year, when the benefit of the member's service is received? Or, some future year when the "IOU" becomes a cash demand?

A Retirement System meets this requirement by having as its *financial objective the establishment and* receipt of contributions, expressed as percents of active member payroll, which will remain approximately level from year-to-year and will not have to be increased for future generations of taxpayers.

Translated into actuarial terminology, a level percent-of-payroll contribution objective means that the contribution rate must be at least:

Normal Cost (the present value of future benefits assigned to members' service being rendered in the current year)

... plus ...

Interest on the Unfunded Actuarial Accrued Liability (the difference between the actuarial accrued liability and current system assets).

The accumulation of invested assets *is a by-product of level percent-of-payroll contributions, not the objective*. Investment income becomes the 3rd major contributor to the retirement program, and the amount is directly related to the amount of contributions and investment performance.

If contributions to the retirement program are less than the preceding amount, the difference, *plus investment earnings not realized thereon*, will have to be contributed at some later time (or benefits will have to be reduced) to satisfy the fundamental fiscal equation under which all retirement programs must operate:

$$B = C + I - E$$

The aggregate amount of **B**enefit payments to any group of members and their beneficiaries cannot exceed the sum of:

The aggregate amount of Contributions received on behalf of the group

... plus ...

Investment earnings on contributions received and not required for immediate cash payments of benefits

. . . minus . . .

The Expenses of operating the program.

There are retirement programs designed to defer the bulk of contributions far into the future. The present contribution rate for such systems is *artificially low*. The fact that the contribution rate is destined to increase relentlessly to a much higher level, is often ignored.

Computed Contribution Rate Needed to Finance Benefits. From a given schedule of benefits and from the data furnished, the actuary calculates the contribution rate by means of an actuarial valuation - the technique of assigning monetary values to the risks assumed in operating a retirement program.

THE ACTUARIAL VALUATION PROCESS

The financing diagram on the previous page shows the relationship between the two fundamentally different philosophies of paying for retirement benefits: the method where contributions match cash benefit payments (or barely exceed cash benefit payments, as in the Federal Social Security program) which is an increasing contribution method; and the level contribution method which equalizes contributions between the generations.

The actuarial valuation is the mathematical process by which the level contribution rate is determined, and the flow of activity constituting the valuation may be summarized as follows:

A. *Covered Person Data*, furnished by plan administrator.

Retired lives now receiving benefits

Former employees with vested benefits not yet payable

Active employees

- B. + Asset data (cash & investments), furnished by plan administrator
- C. + Assumptions concerning future financial experience in various risk areas, which assumptions
 are established by the Retirement Board after consulting with the actuary
- D. + *The funding method* for employer contributions (the long-term, planned pattern for employer contributions)
- E. + Mathematically combining the assumptions, the funding method, and the data
- F. = Determination of:

Plan financial position

and/or New Employer Contribution Rate

ACTUARIAL COST METHODS USED FOR THE VALUATION

Age and Service Benefits, Death and Disability Benefits. Normal cost and the allocation of actuarial present values between service rendered before and after the valuation date were determined using an individual entry-age actuarial cost method having the following characteristics:

- the annual normal costs for each individual active member, payable from the member's date of employment to the member's projected date of retirement, are sufficient to accumulate the actuarial present value of the member's future service benefit at time of retirement;
- (ii) each annual normal cost is a constant percentage of the member's year-by-year projected covered pay.

Amortization of Unfunded Actuarial Accrued Liabilities. Unfunded actuarial accrued liabilities were amortized by level percent-of-payroll contributions (principal and interest combined) over a closed initial period of 24 years. Beginning in 1998, a new basis is created as of each valuation date.

Active member payroll was assumed to increase 4.5% a year for the purpose of determining the level percent contributions.

ACTUARIAL ASSUMPTIONS IN THE VALUATION PROCESS

The actuary calculates contribution requirements and actuarial present values for a retirement system by applying actuarial assumptions to the benefit provisions and people information of the system, using the actuarial cost methods described on page C-5.

The principal areas of risk which require assumptions about future experience are:

- (i) long-term rates of investment return to be generated by the assets of the system
- (ii) patterns of pay increases to members
- (iii) rates of mortality among members, retirants and beneficiaries
- (iv) rates of withdrawal of active members
- (v) rates of disability among active members
- (vi) the age patterns of actual retirements

In making a valuation, the actuary calculates the monetary effect of each assumption for as long as a present covered person survives - - - a period of time which can be as long as a century.

The employer contribution rate has been computed to remain level from year-to-year so long as benefits and the basic experience and make-up of members do not change. Examples of favorable experience, which would tend to reduce the employer contribution rate are:

- (1) Investment returns in excess of 7.75 percent per year.
- (2) Member non-vested terminations at a higher rate than outlined on page C-11.
- (3) Mortality among retirants and beneficiaries at a higher rate than indicated by the 1983 Group Annuity Mortality Table.

Examples of unfavorable experience, which would tend to increase the employer contribution rate are:

- (1) Pay increases in excess of the rates outlined on page C-9.
- (2) An acceleration in the rate of retirement from the rates outlined on page C-12.
- (3) A pattern of hiring employees at older ages than in the past.

Actual experience of the system will not coincide exactly with assumed experience, regardless of the choice of the assumptions, or the skill of the actuary or the precision of the calculations. Each valuation provides a complete recalculation of assumed future experience and takes into account all past differences between assumed and actual experience. The result is a continual series of adjustments (usually small) to the computed contribution rate.

From time to time one or more of the assumptions is modified to reflect experience trends (but not random or temporary year-to-year fluctuations).

ACTUARIAL ASSUMPTIONS USED FOR THE VALUATION

The actuarial assumptions used in the valuation are shown in this Section of the report. The assumptions are consistent with those used in the April 30, 2001 valuation by the prior actuary. An experience study to review economic and non-economic assumptions is to be performed following this valuation.

Economic Assumptions

The investment return rate used in making the valuations was 7.75% per year, compounded annually. The real rate of return is the portion of total investment return, which is more than the wage inflation rate. Considering other financial assumptions, the 7.75% investment return rate translates to an assumed real rate of return of 3.25%. In order to assume a 3.25% real return over wage growth, it would be necessary to realize about a 4.25% real return over price inflation, after accounting for difference between wage increases and price increases.

Pay increase assumptions for individual active members are shown below. Part of the assumed increase at each age is for merit and/or seniority, and the other 4.5% recognizes changes in wage levels due to based.

	Annual Rate of Pay Increase for Sample Ages							
Sample	Base	Merit and						
Ages	(Economic)	Longevity	Total					
20	4.5%	2.5%	7.0%					
25	4.5%	2.5%	7.0%					
30	4.5%	2.4%	6.9%					
35	4.5%	1.9%	6.4%					
40	4.5%	1.3%	5.8%					
45	4.5%	0.5%	5.0%					
50	4.5%	0.5%	5.0%					
55	4.5%	0.5%	5.0%					
60	4.5%	0.5%	5.0%					

Price inflation of 3.5% per year would be consistent with the above assumptions. (This assumption is not utilized in the valuation process.)

The active member payroll is assumed to increase 4.5% annually, which is the portion of the individual pay increase assumptions attributable to broad economic effects.

The number of active members is assumed to continue at the present number.

Non-Economic Assumptions

Mortality Tables. For healthy lives, the 1983 Group Annuity Mortality Table, set back 0 years for men and 0 years for women. Sample values follow:

	Actuarial Present Value of		Futur	e Life
Sample	\$1 Month	\$1 Monthly for Life		cy (ye ars)
Ages	Men	Women	Men	Women
50	\$135.06	\$143.84	29.18	34.92
55	127.14	137.81	24.82	30.24
60	117.18	129.90	20.64	25.67
65	104.97	119.83	16.69	21.29
70	91.48	107.29	13.18	17.13
75	77.33	92.89	10.15	13.37
80	63.28	78.10	7.64	10.20

For disabled lives, the mortality tables used by the Pension Benefit Guaranty Corporation for disabled lives were used. Sample values follow:

	Actuarial Pre	esent Value of	Future Life				
Sample	\$1 Month	\$1 Monthly for Life Men Women		cy (ye ars)			
Ages	Men			Women			
50	\$93.93	\$110.91	15.35	21.40			
55	87.02	106.33	13.43	19.18			
60	81.16	101.30	11.87	17.01			
65	76.49	95.34	10.56	14.82			
70	70.59	87.51	9.13	12.50			
75	62.33	76.44	7.49	10.00			
80	50.81	63.30	5.66	7.62			

These assumptions are used to measure the probabilities of members dying before retirement and the probabilities of each benefit payment being made after retirement.

It was assumed that 100% of deaths-in-service would be non-duty related.

Rates of separation from active membership. The rates do not apply to members eligible to retire and do not include separation on account of death or disability. This assumption measures the probabilities of members remaining in employment.

		% of Active Members						
Sample	Years of	Separating wit	thin Next Year					
Ages	Service	M ale	Female					
	0	30.0%	20.0%					
	1	10.0%	10.0%					
	2	10.0%	10.0%					
	3	10.0%	10.0%					
	4	15.0%	15.0%					
25	5 & Over	8.0%	10.0%					
30		7.0%	10.0%					
35		6.0%	10.0%					
40		4.0%	5.0%					
45		3.5%	3.3%					
50		2.5%	2.6%					
55		0.0%	2.0%					

Rates of Disability. These assumptions represent the probabilities of active members becoming disabled.

Sample	Percent Becoming Disabled
Ages	within Next Year
25	0.023%
30	0.030%
35	0.038%
40	0.053%
45	0.075%
50	0.135%
55	0.270%
60	0.675%
65	3.200%

It was assumed that one-third of disabilities would be duty related.

Rates of Retirement. These rates are used to measure the probabilities of an eligible member retiring during the next year.

Active Members	Retiring Within Next Year
Age	Percent Retiring
55	4%
56	4%
57	4%
58	4%
59	4%
60	5%
61	20%
62	45%
63	5%
64	5%
65	50%
66	10%
67	10%
68	10%
69	10%
70	100%

In addition, 20% of participants attaining 80 points will be assumed to retire during that year if 80 points is attained prior to age 62.

A member was assumed to be eligible for normal retirement after attaining age 65 with 10 years of service. A member was assumed to be eligible for early retirement after attaining age 55 with 10 years of service, or, after attaining age 60 with 5 years of service, or when attained age plus years of service total at least 80.

Present assets (cash & investments) were used with a market value adjustment that spreads differences between actual and assumed return over a closed four-year period. Details of the method may be found in the body of the report on page D-3. Assets may be used in the valuation prior to the final audit.

The data about persons now covered and about present assets were furnished by the System's administrative staff. Although examined for general reasonableness, the data was not audited by the Actuary.

The actuarial valuation computations were made by or under the supervision of a Member of the American Academy of Actuaries (M.A.A.A.) who has experience performing public plan valuations.

SUMMARY OF ASSUMPTIONS USED APRIL 30, 2002

Pensions in an Inflationary Environment

Value of \$1,000/month Retirement Benefit To an Individual Who Retires at Age 55 In an Environment of 3.5% Inflation

Age	Value
55	\$1,000
56	966
57	934
58	902
59	871
60	842
65	709
70	597
75	503
80	423
85	356
90	300

The life expectancy of a 55 year old male retiree is age 80. The life expectancy for a 55 year old female retiree is age 85. Half of the people will outlive their life expectancy. The effects of even moderate amounts of inflation can be significant for those who live to an advanced age. The plan's 3% simple Cola offsets some of the inflation loss.

SUMMARY OF ASSUMPTIONS USED APRIL 30, 2002

MISCELLANEOUS AND TECHNICAL ASSUMPTIONS

Marriage Assumption. 80% of males and 70% of females are assumed to be married for

purposes of death-in-service benefits. 70% of both males and females are assumed to be married for purposes of the supplemental retirement benefit. Males are assumed to be 3 years older than their spouses. Actual reported data is utilized for retirees and

beneficiaries.

Pay Increase Timing. Beginning of (Fiscal) year. This is equivalent to assuming that

reported pays represent amounts paid to members during the year

ended on the valuation date.

Decrement Timing. Decrements of all types are assumed to occur mid-year.

Eligibility Testing. Eligibility for benefits is determined based upon the age nearest

birthday and service nearest whole year on the date decrement.

Benefit Service. Exact fractional service is used to determine the amount of benefit

payable.

Decrement Relativity. Decrement rates are used without adjustment for multiple

decrement table effects.

Decrement Operation. Withdrawal does not operate during retirement eligibility. Death-

in-service and disability rates do not apply during the first year of

employment.

Normal Form of Benefit. The assumed normal form of benefit is a straight life benefit. (This

assumes that the reduced 50% joint & survivor benefit at retirement

is actuarially equivalent.)

Cost of Living. It was assumed that the Retirement Board will grant the full 3.0%

cost of living adjustment each year as allowed by the plan.

Loads. 0.4% of payroll each year for administrative expenses.

Incidence of Contributions. Contributions are assumed to be received continuously throughout

the year based upon the computed percent-of-payroll shown in this report, and the actual payroll payable at the time contributions are made. New entrant normal cost contributions are applied to the

funding of new entrant benefits.

Pay Annualization. Reported pays for members with less than 1 year of service were

annualized for valuation purposes.

DEFINITIONS OF TECHNICAL TERMS

Accrued Service. Service credited under the system, which was rendered before the date of the actuarial valuation.

Actuarial Accrued Liability. The difference between the actuarial present value of system benefits and the actuarial present value of future normal costs. Also referred to as "past service liability."

Actuarial Assumptions. Estimates of future experience with respect to rates of mortality, disability, turnover, retirement, rate or rates of investment income and salary increases. Decrement assumptions (rates of mortality, disability, turnover and retirement) are generally based on past experience, often modified for projected changes in conditions. Economic assumptions (salary increases and investment income) consist of an underlying rate in an inflation-free environment plus a provision for a long-term average rate of inflation.

Actuarial Cost Method. A mathematical budgeting procedure for allocating the dollar amount of the "actuarial present value of future benefits" between future normal costs and actuarial accrued liability. Sometimes referred to as the "actuarial funding method."

Actuarial Equivalent. One series of payments is said to be actuarially equivalent to another series of payments if the two series have the same actuarial present value.

Actuarial Gain (Loss). The difference between actual unfunded actuarial accrued liabilities and anticipated unfunded actuarial accrued liabilities -- during the period between two valuation dates. It is a measurement of the difference between actual and expected experience.

Actuarial Present Value. The amount of funds currently required to provide a payment or series of payments in the future. It is determined by discounting future payments at predetermined rates of interest, and by probabilities of payments.

Amortization. Paying off an interest-discounted amount with periodic payments of interest and (generally) principal -- as opposed to paying off with a lump sum payment.

Normal Cost. The portion of the actuarial present value of future benefits that is assigned to the current year by actuarial cost method. Sometimes referred to as "current service cost."

Unfunded Actuarial Accrued Liabilities. The difference between actuarial accrued liabilities and valuation assets. Sometimes referred to as "unfunded past service liability" or "unfunded supplemental present value."

Most retirement systems have unfunded actuarial accrued liabilities. They arise each time new benefits are added and each time an actuarial loss occurs.

The existence of unfunded actuarial accrued liabilities is not in itself bad, any more than a mortgage on a house is bad. Unfunded actuarial accrued liabilities do not represent a debt that is payable today. What is important is the ability to amortize the unfunded actuarial accrued liabilities and the trend in their amount (after due allowance for devaluation of the dollar).

Valuation Assets. Also referred to as actuarial value of assets, funding value of assets, or smoothed market value of assets.

Valuation assets recognize assumed investment return fully each year. Differences between actual and assumed investment return are phased in over a closed 4-year period. During periods when investment performance exceeds the assumed rate, valuation assets will tend to be less than market value. During periods when investment performance is less than the assumed rate, valuation assets will tend to be greater than market value. If assumed rates are exactly realized for 3 consecutive years, valuation assets will become equal to market value.
