The Retirement Board Police Retirement System of Kansas City, Missouri

Dear Board Members:

Submitted in this report are the results of the Annual Actuarial Valuation of the assets, actuarial values, and contribution requirements associated with benefits provided by the Police Retirement System of Kansas City, Missouri.

The date of the valuation was April 30, 2005.

Valuation results, comments and conclusions are contained in Section A.

The valuation was based upon information concerning Retirement System benefits, financial transactions, and individual members, terminated members, retirants and beneficiaries. Data was checked for year-to-year consistency but was not otherwise audited by us. This information is summarized in Section B.

Descriptions of the actuarial cost methods and actuarial assumptions are contained in Section C, along with a glossary of technical terms.

This report has been prepared by actuaries who have substantial experience valuing public employee retirement systems. To the best of our knowledge this report is complete and accurate and was made in accordance with standards of practice promulgated by the Actuarial Standards Board of the American Academy of Actuaries. The actuarial assumptions used for the valuation produce results which we believe are reasonable.

Respectfully submitted,

Brian B. Murphy, F.S.A.

Brie B May

Mita D. Drazilov, A.S.A.

Valuation Results, Comments, and Recommendations

FINANCIAL OBJECTIVE

The financial objective of the Retirement System is to establish and receive contributions, expressed as percents of active member payroll, which will remain approximately level from year-to-year and will not have to be increased for future generations of citizens.

CONTRIBUTION RATES

The Retirement System is supported by member contributions, City contributions and investment income from Retirement System assets.

Contributions which satisfy the financial objective are determined by an annual actuarial valuation and are sufficient to:

- (1) cover the actuarial present value of benefits assigned to the current year by the actuarial cost methods described in Section C (the normal cost); and
- (2) amortize over a period of future years the actuarial present value of benefits not covered by valuation assets and anticipated future normal costs (unfunded actuarial accrued liability).

Contribution requirements for the fiscal year beginning May 1, 2006 are shown on page A-2.

CONTRIBUTIONS COMPUTED TO MEET THE FINANCIAL OBJECTIVE OF THE RETIREMENT SYSTEM

Contributions Expressed as Percents of Payroll

	as Percents of Payroll			
Contributions for Fiscal Year Beginning May 1	2006	2005		
Normal Cost				
Age & service benefits	19.89 %	19.92 %		
Death and disability benefits	3.30	3.28		
Termination benefits				
Deferred age & service benefits	0.79	0.78		
Refunds of member contributions	1.25	1.26		
Supplemental retirement benefit	0.83	0.84		
Assumed rate for administrative expenses	0.40	0.40		
Total Normal Cost	26.46	26.48		
Amortization Payment				
Scheduled amortization of UAAL*	13.15	10.33		
Total Required Contribution	39.61	36.81		
Member portion	10.55	10.55		
City portion	29.06	26.26		
Total Reported Contribution		30.25		
Member portion		10.55		
City portion#		19.70		

^{*} Unfunded Actuarial Accrued Liabilities.

Unfunded actuarial accrued liabilities were amortized as a level percent of active member payroll. A description of the method may be found on page C-1.

Procedures for determining dollar contribution amounts are described on page A-3.

Comparative contribution amounts for prior fiscal years are shown on page A-5.

[#] It was reported that the City is contributing 19.70% for the fiscal year beginning May 1, 2005.

DETERMINING DOLLAR CONTRIBUTIONS

For any period of time, the percent-of-payroll contribution rate needs to be converted to dollar amounts. We recommend one of the following procedures.

- (1) Contribute dollar amounts at the end of each payroll period which are equal to the City's required computed percent-of-payroll contribution rate of 29.06% shown on page A-2, multiplied by the covered active member payroll for the period. Adjustments should be made as necessary to exclude items of pay that are not covered compensation for Retirement System benefits and to include special payments that are covered compensation.
- (2) Contribute \$21,444,703 on October 31, 2006, based upon the required City contribution rate of 29.06%. This dollar amount was derived by multiplying the percent-of-payroll contribution requirement by the April 30, 2005 valuation payroll, projected to the fiscal year beginning May 1, 2006, using a 1.092 projection factor. If contributions are made on a later schedule, interest should be added at the rate of 0.65% per month.

These two methods are essentially equivalent, and will produce the same result in the long term.

[@] After changes in actuarial assumptions or methods.

The Ratio of Valuation Assets to AAL is a traditional measure of a system's funding progress. Except in years when the system is amended or actuarial assumptions are revised, this ratio can be expected to move gradually toward 100%.

The Ratio of UAAL to Valuation Payroll is another relative index of condition. Actuarial unfunded liabilities represent debt, while active member payroll represents the system's capacity to collect contributions to pay toward debt. The lower the ratio, the greater the financial strength - and vice-versa.

Expected Terminations from Active Employment for Current Active Members

COMMENTS, RECOMMENDATIONS, AND CONCLUSION

Comment A: Based on the results of this valuation and the current procedure of amortizing the unfunded actuarial accrued liability, the computed employer contribution rate is 29.06% of pay for the fiscal year beginning May 1, 2006, an increase from 26.26% last year. This increase is related to the emerging effects of prior investment losses, as mentioned in the 2004 actuarial report. It is also related to the fact that the City is not scheduled to contribute at the recommended level for the fiscal year beginning May 1, 2005. For the long term well being of the retirement system, it is important that required contributions be received.

Comment B: As of April 30, 2005, actuarial accrued liabilities were \$741,001,020 while valuation assets were \$604,560,607, resulting in a funded ratio of 81.6%. The funded ratio is likely to drop again next year as prior investment losses become fully recognized, and more so, if City contributions continue to fall short of the required rate. A declining funded ratio indicates a weakening of the System's financial position, which could among other things, result in an inability to pay future cost-of-living adjustments (COLAs) and in the long term an inability to pay basic benefits.

Comment C: On a market value basis, the System earned 8.0% return on investments this year. The asset smoothing method smoothes gains and losses over 4 year periods. There will continue to be upward pressure on contribution rates as prior losses are recognized, unless those losses are offset by gains from other sources. Market rates of return in excess of the actuarial assumed rate are required to offset that pressure.

Comment D: At its September 2003 meeting, the Board accepted our recommendation that the funding value of assets be constrained to fall in between 80% and 120% of market value. Although it did not affect the results this year, this method change was incorporated into this valuation. The ratio of funding value of assets to market value of assets is currently 100.1%, well within the corridor. This is an improvement over last year when the ratio was 104.6%.

COMMENTS, RECOMMENDATIONS, AND CONCLUSION (CONTINUED)

Recommendation: In a letter dated April 7, 2005, we provided the System with a possible definition of "actuarial soundness" for the purpose of whether or not an annual COLA may be granted to the retired members who were eligible for such COLA. While there is no universal definition of "actuarial soundness", we recommend that the Board adopt a definition of "actuarial soundness" for the purpose of the annual COLA process. The specifics of the definition that the Board adopts may affect the ability of the Board to grant a COLA in 2006 and in future years.

Conclusion: This system, like virtually every other retirement system in the country was battered by the weak investment market that has persisted since March of 2000. The echoes of that period will continue to affect the system as the full effects of the unrealized losses flow through to the value of assets that are recognized in the valuation. Although City contribution rates have been above the computed rates in many prior years, the system is currently being affected by City contributions that are below the computed rate. Two things are important for the continued well being of this system. First, investment return needs to be at least in accordance with assumptions. While the system cannot control investment return, the importance of a sound, well executed investment program cannot be overemphasized. Second, a plan should be instituted for receiving contributions at the levels recommended in the actuarial valuation. Absent such a plan, the day will come when COLAs cannot be paid or when benefit levels will need to be reconsidered.

DERIVATION OF ACTUARIAL GAIN (LOSS)

The actuarial gains or losses realized in the operation of the Retirement System provide an experience test. Actual experience will never (except by coincidence) coincide exactly with assumed experience. It is expected that gains and losses will cancel each other over a period of years, but sizable year-to-year fluctuations are common. Details on the derivation of the actuarial gain (loss) is shown below, along with a year-by-year comparative schedule.

Measurements for Fiscal Year Ended April 30	<u>2005</u>	<u>2004</u>
(1) UAAL* at start of year	\$108,854,996	\$71,444,040
(2) Employer normal cost from last valuation	10,285,613	9,719,645
(3) Actual employer contributions	13,297,605	12,817,176
(4) Interest accrual: (1) x $0.0775 + [(2) - (3)] / 2 \times 0.0775$	8,319,548	5,416,884
(5) Expected UAAL before changes: (1) + (2) - (3) + (4)	114,162,552	73,763,393
(6) Change from benefit changes	none	none
(7) Change from revised actuarial assumptions and miscellaneous	none	none
(8) Expected UAAL after changes: (5) + (6) + (7)	114,162,552	73,763,393
(9) Actual UAAL at end of year	136,440,413	108,854,996
(10) Gain (loss) (8) - (9)	(22,277,861)	(35,091,603)
(11) Gain (loss) as percent of actuarial accrued liabilities at start of year (\$712,273,616)	(3.1%)	(5.1%)

^{*} Unfunded actuarial accrued liability (UAAL).

Year Ended	Actuarial Gain (Loss)
April 30	As % of Beginning Accrued Liabilities
2002	(2.0) %
2003	(6.5)
2004	(5.1)
2005	(3.1)

Summary of Benefit Provisions and Valuation Data Submitted by the Retirement System

BRIEF SUMMARY OF BENEFIT CONDITIONS EVALUATED (APRIL 30, 2005)

Eligibility Amount

SERVICE RETIREMENT

Age 60 with 10 or more years of service or 25 years of service regardless of age. Members must retire at the completion of 30 years of creditable service, or after attaining age 60, whichever occurs first. The Board of Police Commissioners may, however, with the recommendation of the Chief of Police, permit a member to continue in service until age 65, at which time the member must retire.

For a member retiring prior to August 28, 2000, straight life pension equals 2.0% of Final Compensation times years of service, subject to a maximum benefit of 60% of Final Compensation. For a member retiring on or after August 28, 2000, straight life pension equals 2.5% of Final Compensation times years of service, subject to a maximum benefit of 75% of Final Compensation. Final Compensation is the average annual compensation during the two years of service with the highest salary, whether consecutive or otherwise, or during the entire period of service if less than two years. Pensions are payable monthly at one-twelfth of the annual rate.

DEFERRED RETIREMENT

A member with at least 10 years of creditable service who is not terminated by death or retirement, but by order of the Board of Police Commissioners for any reason other than dishonesty, intemperate habits or conviction of a felony.

50% of Final Compensation multiplied by the ratio of the number of creditable years of service to 30. Benefit begins at age 60.

15 or more years of creditable service.

Computed as service retirement but based upon service, Final Compensation and benefit in effect at termination. Benefit begins at age 55.

DEATH AFTER RETIREMENT SURVIVOR'S PENSION

Payable to a surviving spouse, if any, upon the death of a retired member who was receiving a straight life pension. Benefit is payable until death.

Spouse's pension equals 80% of the straight life pension the deceased retirant was receiving. The 80% benefit amount calculated under this provision is in addition to the Supplemental Retirement Benefit.

Payable at death.

A funeral benefit of \$1,000.

BRIEF SUMMARY OF BENEFIT CONDITIONS EVALUATED (CONTINUED) (APRIL 30, 2005)

Eligibility Amount

NON-DUTY DEATH IN SERVICE SURVIVOR'S PENSION

Payable to a surviving spouse, if any, upon death of a member. Benefit is payable until death. If there is no qualified surviving spouse, payable to qualified child or children in equal shares until age 18.

40% of Final Compensation.

Payable to each child under age 18, if any, until the child attains age 18, or, if mentally or physically incapacitated from wage earnings, until the incapacity no longer exists, or age 21 if a full time student.

\$600 annually.

Payable at death.

A funeral benefit of \$1,000.

DUTY DEATH IN SERVICE SURVIVOR'S PENSION

Payable to the surviving spouse, or if there is no surviving spouse, to children under age 21 or to children over age 21 if mentally or physically incapacitated, of a member who died in the line of duty.

In addition to the benefits payable under non-duty death, a lump sum of \$50,000.

NON-DUTY DISABILITY

Payable to a member with 10 or more years of service who has become permanently unable to perform the full and unrestricted duties of a police officer as established by the Board of Police Commissioners.

2.5% of Final Compensation multiplied by years of creditable service payable for the remainder of the officer's life, or as long as the permanent disability continues.

DUTY DISABILITY

Payable to a member as a result of an accident or disease occurring in the line of duty who has become permanently unable to perform the full and unrestricted duties of a police officer as established by the Board of Police Commissioners.

75% of Final Compensation payable for the remainder of the officer's life, or as long as the permanent disability continues. The pension may be subject to offset or reduction by amounts paid or payable under any Workers' Compensation law.

BRIEF SUMMARY OF BENEFIT CONDITIONS EVALUATED (CONTINUED) (APRIL 30, 2005)

Eligibility Amount

MINIMUM PENSION BENEFIT

Any member who retired entitled to a pension benefit and who either has at least 25 years of creditable service or is retired as a result of an injury or illness occurring in the line of duty or course of employment. A surviving spouse qualifies for the minimum monthly benefit if the officer had at least 25 years of creditable service or was retired or died as a result of an injury or illness occurring in the line of duty or course of employment.

Minimum monthly benefit of not less than \$600 in combined pension benefit and cost-of-living adjustments. The minimum monthly pension benefit is in addition to the Supplemental Retirement Benefit.

POST-RETIREMENT BENEFIT INCREASES

Any member may receive during each year, in addition to the officer's base pension, a cost of living adjustment in an amount not to exceed 3% of the officer's base pension. Base pension is the pension computed under the provisions of the law at the date of retirement, without regard to the cost of living adjustment. The cost of living adjustment also applies to benefits being paid to a surviving spouse. The adjustment is normally effective with the May 30th benefit payment.

MEMBER CONTRIBUTIONS

10.55% of compensation. No contributions are required for members after they retire or complete 30 years of service. Effective 8/31/03, member contributions are deducted on a pre-tax basis.

SUPPLEMENTAL RETIREMENT BENEFIT

Current and future retired and disabled members and their surviving spouses are eligible to receive \$420 per month in addition to pension benefits.

OPTIONAL FORM OF BENEFIT PAYMENT

Members retiring with at least 26 or more years of service may elect to take a portion of their benefit as a lump-sum distribution (PLOP). Members electing PLOP will receive an actuarially reduced monthly benefit for their lifetime.

DERIVATION OF FUNDING VALUE OF ASSETS

Valuation Date April 30,		2002	2003	2004	2005	2006	2007	2008

I.	Recognized Rate of Return	6.5 %	1.3 %	1.6%	3.3%			
J.	Market Rate of Return	(2.7)%	(7.5)%	18.5%	8.0%			
K.	Ratio of Funding Value to Market Value	110.5 %	121.5 %	104.6%	100.1%			

Effective with the 2004 valuation, the funding value of assets is constrained to fall within a corridor of 80% to 120% of market value. The Funding Value of Assets recognizes assumed investment return (line E3) fully each year. Differences between actual and assumed investment return (line E4) are phased in over a closed 4-year period. During periods when investment performance exceeds the assumed rate, Funding Value of Assets will tend to be less than market value. During periods when investment performance is less than the assumed rate, Funding Value of Assets will tend to be greater than market value. If assumed rates are exactly realized for 3 consecutive years, funding value will become equal to market value.

Financial Principles,
Actuarial Valuation Process,
Actuarial Cost Methods,
Actuarial Assumptions and
Definitions of Technical Terms

BASIC FINANCIAL PRINCIPLES AND OPERATION OF THE RETIREMENT SYSTEM

Benefit Promises Made Which Must Be Paid For. A retirement program is an orderly means of handing out, keeping track of, and financing pension promises to a group of employees. As each member of the retirement program acquires a unit of service credit the member is, in effect, handed an "IOU" which reads: "The Police Retirement System of Kansas City, Missouri promises to pay you one unit of retirement benefits, payments in cash commencing when you retire."

The principal related financial question is: When shall the money required to cover the "IOU" be contributed? This year, when the benefit of the member's service is received? Or, some future year when the "IOU" becomes a cash demand?

A Retirement System meets this requirement by having as its financial objective the establishment and receipt of contributions, expressed as percents of active member payroll, which will remain approximately level from year-to-year and will not have to be increased for future generations of taxpayers.

Translated into actuarial terminology, a level percent-of-payroll contribution objective means that the contribution rate must be at least:

Normal Cost (the present value of future benefits assigned to members' service being rendered in the current year)

... plus ...

Interest on the Unfunded Actuarial Accrued Liability (the difference between the actuarial accrued liability and current system assets).

The accumulation of invested assets *is a by-product of level percent-of-payroll contributions*, *not the objective*. Investment income becomes the 3rd major contributor to the retirement program, and the amount is directly related to the amount of contributions and investment performance.

If contributions to the retirement program are less than the preceding amount, the difference, *plus investment earnings not realized thereon*, will have to be contributed at some later time (or benefits will have to be reduced) to satisfy the fundamental fiscal equation under which all retirement programs must operate:

$$B = C + I - E$$

The aggregate amount of **B**enefit payments to any group of members and their beneficiaries cannot exceed the sum of:

The aggregate amount of Contributions received on behalf of the group

... plus ...

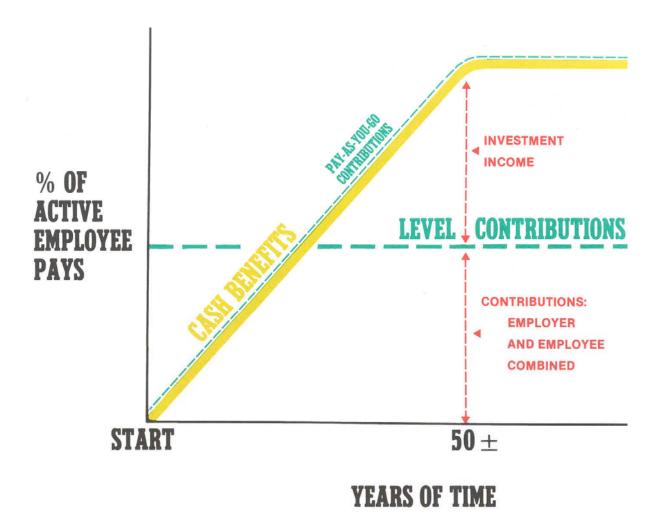

Investment earnings on contributions received and not required for immediate cash payments of benefits

. . . minus . . .

The Expenses of operating the program.

There are retirement programs designed to defer the bulk of contributions far into the future. The present contribution rate for such systems is *artificially low*. The fact that the contribution rate is destined to increase relentlessly to a much higher level, is often ignored.

Computed Contribution Rate Needed to Finance Benefits. From a given schedule of benefits and from the data furnished, the actuary calculates the contribution rate by means of an actuarial valuation - the technique of assigning monetary values to the risks assumed in operating a retirement program.

CASH BENEFITS LINE. This relentlessly increasing line is the fundamental reality of retirement plan financing. It happens each time a new benefit is added for future retirements (and happens regardless of the design for contributing for benefits).

LEVEL CONTRIBUTION LINE. Determining the level contribution line requires detailed assumptions concerning a variety of experiences in future decades, including:

Economic Risk Areas

Rates of investment return

Rates of pay increase

Changes in active member group size

Non-Economic Risk Areas

Ages at actual retirement

Rates of mortality

Rates of withdrawal of active members (turnover)

Rates of disability

THE ACTUARIAL VALUATION PROCESS

The financing diagram on the previous page shows the relationship between the two fundamentally different philosophies of paying for retirement benefits: the method where contributions match cash benefit payments (or barely exceed cash benefit payments, as in the Federal Social Security program) which is an increasing contribution method; and the level contribution method which equalizes contributions between the generations.

The actuarial valuation is the mathematical process by which the level contribution rate is determined, and the flow of activity constituting the valuation may be summarized as follows:

A. *Covered Person Data*, furnished by plan administrator.

Retired lives now receiving benefits

Former employees with vested benefits not yet payable

Active employees

B. + Asset data (cash & investments), furnished by plan administrator

C. + Assumptions concerning future financial experience in various risk areas, which assumptions are established by the Retirement Board after consulting with the actuary

D. + *The funding method* for employer contributions (the long-term, planned pattern for employer contributions)

E. + Mathematically combining the assumptions, the funding method, and the data

F. = Determination of:

Plan financial position

and/or New Employer Contribution Rate

ACTUARIAL COST METHODS USED FOR THE VALUATION

Age and Service Benefits, Death and Disability Benefits. Normal cost and the allocation of actuarial present values between service rendered before and after the valuation date were determined using an individual entry-age actuarial cost method having the following characteristics:

- (i) the annual normal costs for each individual active member, payable from the member's date of employment to the member's projected date of retirement, are sufficient to accumulate the actuarial present value of the member's future service benefit at time of retirement;
- (ii) each annual normal cost is a constant percentage of the member's year-by-year projected covered pay.

Amortization of Unfunded Actuarial Accrued Liabilities. Unfunded actuarial accrued liabilities were amortized by level percent-of-payroll contributions (principal and interest combined) over a closed initial period of 24 years. Beginning in 1998, a new basis is created as of each valuation date. The single equivalent amortization period is 20.46 years.

Active member payroll was assumed to increase 4.5% a year for the purpose of determining the level percent contributions.

ACTUARIAL ASSUMPTIONS IN THE VALUATION PROCESS

The actuary calculates contribution requirements and actuarial present values for a retirement system by applying actuarial assumptions to the benefit provisions and people information of the system, using the actuarial cost methods described on page C-5.

The principal areas of risk which require assumptions about future experience are:

- (i) long-term rates of investment return to be generated by the assets of the system
- (ii) patterns of pay increases to members
- (iii) rates of mortality among members, retirants and beneficiaries
- (iv) rates of withdrawal of active members
- (v) rates of disability among active members
- (vi) the age patterns of actual retirements

In making a valuation, the actuary calculates the monetary effect of each assumption for as long as a present covered person survives - - - a period of time which can be as long as a century.

The employer contribution rate has been computed to remain level from year-to-year so long as benefits and the basic experience and make-up of members do not change. Examples of favorable experience, which would tend to reduce the employer contribution rate are:

- (1) Investment returns in excess of 7.75 percent per year.
- (2) Member non-vested terminations at a higher rate than outlined on page C-11.
- (3) Mortality among retirants and beneficiaries at a higher rate than indicated by the 1983 Group Annuity Mortality Table.

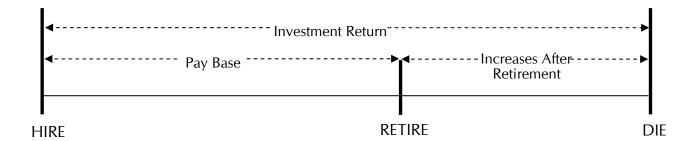

Examples of unfavorable experience, which would tend to increase the employer contribution rate are:

- (1) Pay increases in excess of the rates outlined on page C-9.
- (2) An acceleration in the rate of retirement from the rates outlined on page C-12.
- (3) A pattern of hiring employees at older ages than in the past.

Actual experience of the system will not coincide exactly with assumed experience, regardless of the choice of the assumptions, or the skill of the actuary or the precision of the calculations. Each valuation provides a complete recalculation of assumed future experience and takes into account all past differences between assumed and actual experience. The result is a continual series of adjustments (usually small) to the computed contribution rate.

From time to time one or more of the assumptions is modified to reflect experience trends (but not random or temporary year-to-year fluctuations).

Relationship of Economic Assumptions In Computing Contributions to a Retirement System

Investment Return

An increase in this assumption reduces computed contributions. The assumption operates over all parts of an employee's lifetime.

Pay Base

An increase in this assumption increases computed contributions. However, a 1% increase in this assumption, coupled with a 1% increase in Investment Return reduces computed contributions. This is because the Pay Base assumption operates only over an employee's working lifetime, while the Investment Return assumption operates over the employee's entire lifetime, and therefore has a greater effect.

Increases After Retirement

An increase in this element increases computed contributions.

If Investment Return, Pay Base, and Increases After Retirement are each increased by equal amounts, computed contributions remain the same (except in plans using Final Average Pay as a factor in computing benefits; the multi-year average used for Final Average Pay causes computed contributions to decrease slightly).

If Investment Return and Pay Base are increased by equal amounts, with no change in Increases After Retirement, computed contributions decrease - sometimes significantly. The decreases represent the projected devaluation of an employee's benefits following retirement.

ACTUARIAL ASSUMPTIONS USED FOR THE VALUATION

The assumptions and the methods comply with the requirements of Statement No. 25 of the Governmental Accounting Standards Board. The April 30, 2005 actuarial valuation includes assumptions and methods resulting from the experience study covering the 5-year period from May 1, 1997 to April 30, 2002.

Economic Assumptions

The investment return rate used in making the valuations was 7.75% per year, compounded annually. The real rate of return is defined to be the portion of total investment return which is more than the wage inflation rate. Considering other financial assumptions, the 7.75% investment return rate translates to an assumed real rate of return of 3.25%. In order to assume a 3.25% real return over wage growth, it would be necessary to realize about a 4.25% real return over price inflation, after accounting for differences between wage increases and price increases.

Pay increase assumptions for individual active members are shown below. Part of the assumed increase at each age is for merit and/or seniority, and the other 4.5% recognizes changes in wage levels due to broad economic effects, including inflation and real wage growth.

Annual Rate	mple Ages	
Base	Merit and	
(Economic)	Longevity	Total
4.5%	4.4%	8.9%
4.5%	3.8%	8.3%
4.5%	3.3%	7.8%
4.5%	2.8%	7.3%
4.5%	1.6%	6.1%
4.5%	0.7%	5.2%
4.5%	0.5%	5.0%
4.5%	0.5%	5.0%
4.5%	0.5%	5.0%
	Base (Economic) 4.5% 4.5% 4.5% 4.5% 4.5% 4.5% 4.5%	(Economic) Longe vity 4.5% 4.4% 4.5% 3.8% 4.5% 3.3% 4.5% 2.8% 4.5% 1.6% 4.5% 0.7% 4.5% 0.5% 4.5% 0.5%

Price inflation of 3.5% per year would be consistent with the above assumptions. (This assumption is not utilized in the valuation process.)

The active member payroll is assumed to increase 4.5% annually, which is the portion of the individual pay increase assumptions attributable to broad economic effects.

The number of active members is assumed to continue at the present number.

Non-Economic Assumptions

Mortality Tables. For healthy lives, the 1983 Group Annuity Mortality Table, set back 0 years for men and 0 years for women. Male and female officers still in employment are assumed to be subject to 75% of the previously described mortality tables. Sample values follow:

	Actuarial Present Value of		Futur	e Life
Sample	\$1 Monthly for Life		Expectan	cy (years)
Ages	M ale	Male Female		Female
50	\$135.06	\$143.84	29.18	34.92

These assumptions are used to measure the probabilities of members dying before retirement and the probabilities of each benefit payment being made after retirement.

It was assumed that 20% of deaths-in-service would be duty related.

Rates of separation from active membership. The rates do not apply to members eligible to retire and do not include separation on account of death or disability. This assumption measures the probabilities of members remaining in employment.

	% of Active Members Separating within Next Year			
Sample				
Ages	M ale	Female		
25	6.4%	6.7%		
30	4.5%	5.6%		
35	2.8%	4.2%		
40	2.0%	2.0%		
45	1.1%	0.5%		
50	0.7%	0.0%		

Rates of Disability. These assumptions represent the probabilities of active members becoming disabled. It was assumed that 55% of disabilities would be duty related.

60	1.984%	3.968%		

Rates of Retirement. These rates are used to measure the probabilities of an eligible member retiring during the next year.

Active Members Retiring Within Next Year

Treat to the most of the treat to the first				
Years of Service	Percent Retiring			
25	30%			
26	30%			
27	30%			
28	25%			
29	40%			
30	100%			

Present assets (cash & investments) were used with a market value adjustment that spreads differences between actual and assumed return over a closed four-year period. Details of the method may be found in the body of the report on page B-4. Assets may be used in the valuation prior to the final audit.

The data about persons now covered and about present assets were furnished by the System's administrative staff. Although examined for general reasonableness, the data was not audited by the Actuary.

The actuarial valuation computations were made by or under the supervision of a Member of the American Academy of Actuaries (M.A.A.A.) who has experience performing public plan valuations.

SUMMARY OF ASSUMPTIONS USED APRIL 30, 2005

Pensions in an Inflationary Environment

Value of \$1,000/month Retirement Benefit To an Individual Who Retires at Age 50 In an Environment of 3.5% Inflation with a 3% Simple COLA

Age	Value
50	\$1,000
51	995
52	990
53	983
54	976
55	968
60	922
65	865
70	804
75	741
80	677
85	615

The life expectancy of a 50 year old male retiree is age 79. The life expectancy for a 50 year old female retiree is age 85. Approximately half of the people will outlive their life expectancy. The effects of even moderate amounts of inflation can be significant for those who live to an advanced age.

SUMMARY OF ASSUMPTIONS USED APRIL 30, 2005

MISCELLANEOUS AND TECHNICAL ASSUMPTIONS

Marriage Assumption. 85% of males and 55% of females are assumed to be married for

purposes of death-in-service benefits and death-after-retirement benefits. Males are assumed to be 3 years older than their spouses.

Actual reported data is utilized for retirees and beneficiaries.

Pay Increase Timing. Beginning of (Fiscal) year. This is equivalent to assuming that

reported pays represent amounts paid to members during the year

ended on the valuation date.

Decrement Timing. Decrements of all types are assumed to occur mid-year.

Eligibility Testing. Eligibility for benefits is determined based upon the age nearest

birthday and service nearest whole year on the date of decrement.

Benefit Service. Exact fractional service is used to determine the amount of benefit

payable.

Decrement Relativity. Decrement rates are used without adjustment for multiple decrement

table effects.

Decrement Operation. Withdrawal does not operate during retirement eligibility.

Normal Form of Benefit. The assumed normal form of benefit is 80% joint and survivor.

Cost of Living. It was assumed that the Retirement Board will grant the full 3.0%

cost of living adjustment each year as allowed by the plan.

Loads. 0.4% of payroll each year for administrative expenses.

Administrative and investment expenses above and beyond this allocation are assumed to be funded by investment return in excess of

the actuarial assumed rate.

Incidence of Contributions. Contributions are assumed to be received continuously throughout

the year based upon the computed percent-of-payroll shown in this report, and the actual payroll payable at the time contributions are made. New entrant normal cost contributions are applied to the

funding of new entrant benefits.

Pay Annualization. Reported pays for members with less than 1 year of service were

annualized for valuation purposes.

DEFINITIONS OF TECHNICAL TERMS

Accrued Service. Service credited under the system, which was rendered before the date of the actuarial valuation.

Actuarial Accrued Liability. The difference between the actuarial present value of system benefits and the actuarial present value of future normal costs. Also referred to as "past service liability."

Actuarial Assumptions. Estimates of future experience with respect to rates of mortality, disability, turnover, retirement, rate or rates of investment income and salary increases. Decrement assumptions (rates of mortality, disability, turnover and retirement) are generally based on past experience, often modified for projected changes in conditions. Economic assumptions (salary increases and investment income) consist of an underlying rate in an inflation-free environment plus a provision for a long-term average rate of inflation.

Actuarial Cost Method. A mathematical budgeting procedure for allocating the dollar amount of the "actuarial present value of future benefits" between future normal costs and actuarial accrued liability. Sometimes referred to as the "actuarial funding method."

Actuarial Equivalent. One series of payments is said to be actuarially equivalent to another series of payments if the two series have the same actuarial present value.

Actuarial Gain (Loss). The difference between actual unfunded actuarial accrued liabilities and anticipated unfunded actuarial accrued liabilities -- during the period between two valuation dates. It is a measurement of the difference between actual and expected experience.

Actuarial Present Value. The amount of funds currently required to provide a payment or series of payments in the future. It is determined by discounting future payments at predetermined rates of interest, and by probabilities of payments.

Amortization. Paying off an interest-discounted amount with periodic payments of interest and (generally) principal -- as opposed to paying off with a lump sum payment.

Normal Cost. The portion of the actuarial present value of future benefits that is assigned to the current year by actuarial cost method. Sometimes referred to as "current service cost."

Unfunded Actuarial Accrued Liabilities. The difference between actuarial accrued liabilities and valuation assets. Sometimes referred to as "unfunded past service liability" or "unfunded supplemental present value."

Most retirement systems have unfunded actuarial accrued liabilities. They arise each time new benefits are added and each time an actuarial loss occurs.

The existence of unfunded actuarial accrued liabilities is not in itself bad, any more than a mortgage on a house is bad. Unfunded actuarial accrued liabilities do not represent a debt that is payable today. What is important is the ability to amortize the unfunded actuarial accrued liabilities and the trend in their amount (after due allowance for devaluation of the dollar).

Valuation Assets. Also referred to as actuarial value of assets, funding value of assets, or smoothed market value of assets.

Valuation assets recognize assumed investment return fully each year. Differences between actual and assumed investment return are phased in over a closed 4-year period. During periods when investment performance exceeds the assumed rate, valuation assets will tend to be less than market value. During periods when investment performance is less than the assumed rate, valuation assets will tend to be greater than market value. If assumed rates are exactly realized for 3 consecutive years, valuation assets will become equal to market value.

This information is presented in draft form for review by the City's auditor. Please let us know if there are any items that the auditor changes so that we may maintain consistency with the City's financial statements.

GASB STATEMENTS NO. 25 AND NO. 27 REQUIRED SUPPLEMENTARY INFORMATION

The information presented in the required supplementary schedules was determined as part of the actuarial valuations at the dates indicated. Additional information as of the latest valuation date follows:

Valuation date April 30, 2005

Actuarial cost method Individual entry age

Amortization method for unfunded

actuarial accrued liabilities Level percent closed

Equivalent single amortization

period 20.46 years

Asset valuation method 4-year smoothed market

Actuarial assumptions:

Investment rate of return 7.75%

Projected salary increases

including wage inflation at 4.5% 4.5% - 8.9% Cost-of-living adjustments 3.0% simple

Membership of the plan consisted of the following at April 30, 2005, the date of the latest actuarial valuation:

Retirees and beneficiaries receiving benefits	1,174
Terminated plan members entitled to but	
not yet receiving benefits	10
Active plan members	1,285
Total	2,469

October 4, 2005

Mr. James J. Pyle Pension Systems Manager Kansas City Police Employees' Retirement Systems 1328 Agnes Kansas City, Missouri 64127

Dear Jim:

Enclosed are twenty report copies of the April 30, 2005 Actuarial Valuation of the Police Retirement System of Kansas City, Missouri. A copy will be forwarded to your auditor.

Please call if you have any questions or comments.

Sincerely,

Mita D. Drazilov
