The Retirement Board
City of Sioux Falls Firefighters' Pension Fund
Sioux Falls, South Dakota

Ladies and Gentlemen:

Presented in this report are the results of the **Forty-Eighth Annual Actuarial Valuation** of the assets, actuarial values and contribution requirements associated with pension and post-retirement health insurance benefits provided by the City of Sioux Falls Firefighters' Pension Fund. The purpose of the valuation was to measure the System's funding progress and to determine a contribution rate for the second following calendar year.

The date of the valuation was December 31, 2003.

The valuation was based upon information, furnished by your Secretary, concerning Pension Fund benefits, financial transactions, and individual members, terminated members, retirees and beneficiaries. Data was checked for year-to-year consistency but was not otherwise audited.

To the best of our knowledge this report is complete and accurate and was made in accordance with standards of practice prescribed by the Actuarial Standards Board and in compliance with the statutes governing the Pension Fund. The actuarial assumptions used for the valuation produce results which we believe are reasonable.

Respectfully submitted,

Louise M. Gates, ASA, MAAA

W. James Koss, ASA, EA, MAAA

LMG/WJK:dm

SECTION A

VALUATION RESULTS

FINANCIAL OBJECTIVE

The financial objective of the Pension Fund is to establish and receive contributions, expressed as percents of active member payroll, which will remain approximately level from year-to-year and will accumulate reserves during members' working lifetimes which will be sufficient to pay promised benefits throughout retirement.

CONTRIBUTION RATES

The Pension Fund is supported by member contributions, City contributions, State contributions (insurance premium taxes) and investment income from Pension Fund assets.

Contributions which satisfy the financial objective are determined by an annual actuarial valuation and are sufficient to:

- (1) cover the actuarial present value of benefits assigned to the current year by the actuarial cost methods described in Section C (the normal cost); and
- (2) amortize over a period of future years the actuarial present value of benefits not covered by valuation assets and anticipated future normal costs (unfunded actuarial accrued liability).

Contribution requirements for the year beginning January 1, 2005 are shown on page A-2.

**CONTRIBUTIONS COMPUTED TO MEET THE
FINANCIAL OBJECTIVE OF THE PENSION FUND
FOR THE YEAR BEGINNING JANUARY 1, 2005
(INCLUDING STATE CONTRIBUTIONS)**

Contributions for	Range of Contribution Requirements Expressed as Percents of Payroll
Normal Cost	
Age & service benefits	15.68 %
Death-in-service benefits	0.77
Disability benefits	0.81
Termination benefits	
Deferred age & service benefits	0.15
Refunds of member contributions	<u>0.83</u>
Total Normal Cost	18.24 %
Unfunded Actuarial Accrued Liabilities	
Total UAAL Contribution	0.88 %
Total Computed Contribution Rate	
Member portion	<u>8.00</u>
City-State portion	11.12 %

Unfunded actuarial accrued liabilities (UAAL) were amortized as a level percent of active member payroll over a period of 20 years.

ACTIVE AND RETIRED MEMBERS

BENEFITS AS A PERCENT OF PAYROLL

**COMPUTED AND ACTUAL CITY-STATE PENSION CONTRIBUTIONS

ACTUARIAL PENSION BALANCE SHEET - DECEMBER 31, 2003

Present Resources and Expected Future Resources

A. Valuation assets	\$70,428,739
B. Actuarial present value of expected future employer contributions	
1. For normal costs	7,941,755
2. For unfunded actuarial accrued liabilities	1,125,209
3. Total	<u>9,066,964</u>
C. Actuarial present value of expected future member contributions	<u>6,160,462</u>
D. Total Actuarial Present Value of Present and Expected Future Resources	<u><u>\$85,656,165</u></u>

Actuarial Present Value of Expected Future Benefit Payments and Reserves

A. To retirees and beneficiaries	\$36,127,984
B. To vested terminated members	1,198,116
C. To present active members	
1. Allocated to service rendered prior to valuation date	34,227,848
2. Allocated to service likely to be rendered after valuation date	14,102,217
3. Total	<u>48,330,065</u>
D. Reserves	
1. Allocated to retirants and beneficiaries	0
2. Unallocated investment income	0
3. Total	0
E. Total Actuarial Present Value of Expected Future Benefit Payments and Reserves	<u><u>\$85,656,165</u></u>

DERIVATION OF ACTUARIAL GAIN (LOSS) YEAR ENDED DECEMBER 31, 2003

The actuarial gains or losses realized in the operation of the Pension Fund provide an experience test. Gains and losses are expected to cancel each other over a period of years (in the absence of double-digit inflation) and sizable year to year fluctuations are common. Detail on the derivation of the actuarial gain (loss) is shown below, along with a year by year comparative schedule.

(1) UAAL* at start of year	\$ (916,415)
(2) Normal cost	845,429
(3) Actual contributions	653,835
(4) Interest accrual	(65,649)
(5) Expected UAAL before changes	(790,471)
(6) Change from benefit increases	none
(7) Change from revised actuarial methods	none
(8) Expected UAAL after changes	(790,471)
(9) Actual UAAL at end of year	1,125,209
(10) Gain (loss) (8) - (9)	(1,915,680)
(11) Gain (loss) as percent of actuarial accrued liabilities at start of year	(2.9)%

* *Unfunded actuarial accrued liability*

Valuation Date December 31	Actuarial Gain (Loss) As % of Beginning Accrued Liabilities

@ After changes in actuarial assumptions or methods.

COMMENTS, RECOMMENDATIONS, AND CONCLUSIONS

Comment A: Pension plan experience was overall unfavorable during the year ended December 31, 2003. Investment income on a funding value basis was lower than the long-term assumed rate, due to delayed recognition of prior year's investment losses. This was the primary source of unfavorable experience and was offset in part by favorable retiree experience (lower COLA than expected). The funding value yield on System assets for the period ending December 31, 2003 was 5.8% versus 26.2% on a market value basis.

Comment B: During the year ended December 31, 2003, there were no plan provision changes reported to the actuary.

Comment C: The results of an actuarial valuation will be only as meaningful as the information it is based on. We are using the conventional premium provided in connection with the valuation as the measure of the cost of providing retiree health benefits currently. This year they appeared to be reasonable. In order to perform next year's valuation, we will need additional information related to the development of the premium rates. This additional information will be needed to comply with new actuarial standards of practice applicable to retiree health programs. We will contact the City in the near future to discuss a procedure for collecting this information.

Comment D: The method used in this valuation to develop premiums recognizes the change in utilization of medical plans among retirees in light of recent changes in the medical plan. This method recognizes a weighted average of premiums from both the indemnity and managed care plans in developing retiree health contribution rates. In addition, the indemnity plan premiums used in the valuation of the health plan, recognize the higher level (i.e., unsubsidized) of pre-65 retiree health premiums. This increased total valuation premiums by 31%. The premiums used are shown in Section C of this report.

Contribution Summary For the Year Beginning January 1, 2005

Contributions for	Computed Employer Contributions Expressed As Percents of Payroll		
	Pension	Health	Total
Total Normal Cost	18.24 %	1.68 %	19.92 %
Unfunded Actuarial Accrued Liability Total UAAL Contribution (1)	0.88	2.75	3.63

Member portion	8.00	0.00	8.00
City-State portion	11.12 %	4.43 %	15.55 %

- (1) Unfunded actuarial accrued liabilities were amortized as a level percent of active member payroll over 20 years.

SECTION B

**SUMMARY of BENEFIT PROVISIONS
AND VALUATION DATA**

**BENEFIT PROVISIONS EVALUATED
AND/OR CONSIDERED
(DECEMBER 31, 2003)**

Regular Retirement:

Eligibility - Age 55 with 20 or more years of service; or the sum of a member's age and years of service equals eighty (80) with a minimum retirement age of 50.

Annual Amount - Final average compensation times the sum of a) 2.5% times the first 25 years of service, plus b) 1.5% times service in excess of 25 years.

Type of Final Average Compensation - Average of last 3 years before retirement. Some lump sums are included.

Early Reduced Retirement:

Eligibility - 20 or more years of service.

Annual Amount - Same as regular retirement except that the benefit is actuarially reduced.

Deferred Retirement (vested benefit):

Eligibility - 15 years of service; benefit payable at age 60.

Annual Amount- Computed as a regular retirement benefit but based on service and final average compensation at termination.

Duty Disability Retirement:

Eligibility - No age or service requirements. Must be in receipt of Workers' Compensation.

Annual Amount - Computed as a regular retirement benefit, based on a minimum of 10 years of service. Minimum benefit is 50% of a first-class firefighter's salary. Workers' compensation payments are offset.

**BENEFIT PROVISIONS EVALUATED
AND/OR CONSIDERED
(DECEMBER 31, 2003)**

Non-Duty Disability Retirement:

Eligibility - 10 years of service.

Annual Amount - Computed as a regular retirement benefit. Minimum benefit is 20% of a first-class firefighter's salary.

Duty Death Before Retirement:

Eligibility - No age or service requirement. Also payable in case of death of duty-disability retiree within 5 years of retirement. Workers' Compensation must be payable.

Annual Amount - Refund of accumulated contributions. Spouse receives a pension of 1/3 of first-class firefighter's salary until death. Unmarried children under age 18 or an eligible handicapped child will receive equal share of 1/4 of a first-class firefighter's salary (if no spouse, each child receives 1/4 to a maximum of 1/2). The minimum monthly benefit for each eligible child is \$200. If there are no spouse or eligible children, dependent parents each receive 1/6 of a first-class firefighter's salary. Workers' Compensation payments are offset.

Non-Duty Death Before Retirement:

Eligibility - 10 years of service.

Annual Amount - Surviving spouse receives a monthly benefit for life computed as a regular retirement benefit but actuarially reduced in accordance with a 100% joint and survivor election. In addition each eligible or handicapped child is paid a minimum monthly benefit of \$200.

Post-Retirement Cost-of-Living Adjustments:

An annual increase equal to 100% of the CPI change in June of each year with a cap of 3%. The first increase is granted after 36 months of retirement.

Member Contributions:

8% of compensation.

SECTION C

**FINANCIAL PRINCIPLES
AND ACTUARIAL VALUATION
PROCESS**

ACTUARIAL COST METHODS USED FOR THE VALUATION

Normal cost and the allocation of actuarial present values between service rendered before and after the valuation date were determined using an individual entry-age actuarial cost method having the following characteristics:

- (i) the annual normal costs for each individual active member, payable from the member's actual date of employment to projected date of retirement, are sufficient to accumulate the actuarial present value of the member's benefit at the time of retirement;
- (ii) each annual normal cost is a constant percentage of the member's year-by-year projected covered pay.

Amortization of Unfunded Actuarial Accrued Liabilities.

Unfunded actuarial accrued liabilities were amortized as a level percent of active member payroll over a period of 20 years.

Active member payroll was assumed to increase 4.5% a year for the purpose of determining the level percent contributions.

ACTUARIAL ASSUMPTIONS IN THE VALUATION PROCESS

The actuary calculates contribution requirements and actuarial present values of a retirement system by applying actuarial assumptions to the benefit provisions and people information of the system, using the actuarial cost methods described on page C-1.

The principal areas of risk which require assumptions about future experience are:

- long-term rates of investment return to be generated by the assets of the system
- patterns of pay increases to members
- rates of mortality among members, retirees and beneficiaries
- rates of withdrawal of active members
- rates of disability among active members
- the age patterns of actual retirements.

In making a valuation, the actuary calculates the monetary effect of each assumption for as long as a present covered person survives - - - a period of time which can be as long as a century.

The employer contribution rate has been computed to remain level from year to year so long as benefits and the basic experience and make-up of members do not change. Examples of favorable experience which would tend to reduce the employer contribution rate are:

- (1) Investment returns in excess of 8% per year.
- (2) Member non-vested terminations at a higher rate than outlined on page C-6.
- (3) Mortality among retirees and beneficiaries at a higher rate than indicated by the 1983 Group Annuity Mortality Table.
- (4) Increases in the number of active members.

ACTUARIAL ASSUMPTIONS IN THE VALUATION PROCESS

Examples of unfavorable experience which would tend to increase the employer contribution rate are:

- (1) Pay increases in excess of the rates outlined on page C-4.
 - (2) An acceleration in the rate of retirement from the rates outlined on page C-7.
 - (3) A pattern of hiring employees at older ages than in the past.
-

Actual experience of the system will not coincide exactly with assumed experience, regardless of the choice of the assumptions, or the skill of the actuary and the precision of the calculations. Each valuation provides a complete recalculation of assumed future experience and takes into account all past differences between assumed and actual experience. The result is a continual series of adjustments (usually small) to the computed contribution rate.

From time to time one or more of the assumptions are modified to reflect experience trends (but not random or temporary year to year fluctuations).

Asset Valuation Method

Valuation assets are equal to reported market value of assets. Investment gains and losses are spread over a period of 5 years, with 20% recognition the first year. Such spreading reduces the fluctuation in the City's computed contribution rate which might otherwise be caused by market value fluctuations. The details of this spreading technique are shown in Section B of this report.

ACTUARIAL ASSUMPTIONS USED FOR THE VALUATION

Investment Return (net of administrative expenses).

8.00% per year, compounded annually. This rate consists of a net real rate of return of 3.50% a year plus a long-term rate of wage inflation of 4.5% a year.

This assumption is used to equate the value of payments due at different points in time and was first used for the December 31, 1997 valuation. Approximate rates of investment return, for the purpose of comparisons with assumed rates, are shown below. The average increases in active member pay are also shown for comparative purposes.

	Year Ended December 31,				
	2003	2002	2001	2000	1999
Rate of Investment Return	5.8%	4.0%	10.7%	12.8%	15.5%
Average Increase in Pay	8.1	3.7	9.3	(1.1)	0.8

The nominal rate of return was computed using the approximate formula $i = I$ divided by $1/2(A + B - I)$, where I is actual investment income net of expenses, A is the beginning of year asset value, and B is the end of year asset value.

These rates of return should not be used for measurement of an investment advisor's performance or for comparisons with other systems -- *to do so will mislead.*

Pay Projections. These assumptions are used to project current pays to those upon which benefits will be based. The assumptions were first used for the December 31, 1997 valuation.

Sample Ages	Annual Rate of Pay Increase for Sample Ages		
	Base (Economic)	Merit and Longevity	Total
20	4.5 %	1.7 %	6.2 %
25	4.5	1.6	6.1
30	4.5	1.2	5.7
35	4.5	0.9	5.4
40	4.5	0.4	4.9
45	4.5	0.3	4.8
50	4.5	0.2	4.7
55	4.5	0.2	4.7
60	4.5	0	4.5

ACTUARIAL ASSUMPTIONS USED FOR THE VALUATION

If the number of active members remains constant, the total active member payroll will increase 4.5% annually, the base portion of the individual pay increase assumptions. This increasing payroll was recognized in amortizing unfunded actuarial accrued liabilities.

Changes actually experienced in average pay and total payroll have been as follows:

Increase in	Year Ended December 31				
	2003	2002	2001	2000	1999
Average pay	8.1	3.7	9.3	(1.1)	0.8
Total payroll	9.4	11.3	10.0	(0.5)	0.2

Mortality Table. The 1983 Group Annuity Mortality Table. This table was first used for the December 31, 1997 valuation. Sample values follow:

Sample Ages	Actuarial Present Value of		Future Life	
	\$1 Monthly for Life		Expectancy (Years)	
	Men	Women	Men	Women
55	\$124.57	\$134.74	24.82	30.23
60	115.04	127.23	20.64	25.67
65	103.26	117.61	16.69	21.28
70	90.18	105.53	13.18	17.13
75	76.40	91.57	10.15	13.37
80	62.65	77.15	7.64	10.20

This assumption is used to measure the probabilities of members dying before retirement and the probabilities of each benefit payment being made after retirement.

ACTUARIAL ASSUMPTIONS USED FOR THE VALUATION

Rates of separation from active membership. The rates do not apply to members eligible to retire and do not include separation on account of death or disability. This assumption measures the probabilities of members remaining in employment.

Sample Ages	Years of Service	Current Rates Percent Separating within Next Year
ALL	0	15.0 %
	1	10.0
	2	8.0
	3	7.0
	4	6.0
25	5 & Over	2.5
30		2.0
35		1.5
40		1.0
45		0.5
50		-
55		-
60		-

The current rates were first used in the December 31, 1993 valuation.

Rates of Disability. These assumptions represent the probabilities of active members becoming disabled.

Sample Ages	Percent Becoming Disabled within Next Year
20	0.08 %
25	0.08
30	0.08
35	0.08
40	0.20
45	0.26
50	0.49
55	0.89

These rates were first used for the December 31, 1976 valuation.

ACTUARIAL ASSUMPTIONS USED FOR THE VALUATION

Rates of Retirement. These rates are used to measure the probabilities of an eligible member retiring during the next year.

Retirement Ages	Percents of Active Members Retiring within Next Year	
	Regular Retirement Rates	Early Retirement Rates
50	30 %	5 %
51	30	5
52	30	5
53	30	5
54	30	5
55	30	
56	20	
57	20	
58	20	
59	30	
60 & Over	100	

A member was assumed to be eligible for regular retirement after attaining age 55 with 20 or more years of service, or if the sum of age and service equals eighty (80). A member was assumed to be eligible for early reduced retirement after completing 20 years of service and attaining age 50.

The current rates were first used for the December 31, 1997 valuation.

Lump sum payments included in the calculation of the average pay upon which benefits are computed were assumed to increase benefits by 10 percent.

Active Member Group Size. The number of active members was assumed to remain constant. This assumption is unchanged from previous valuations.

POST-RETIREMENT HEALTH INSURANCE

The City supplied a current schedule of City-paid premiums and a list of current retirees indicating the type of coverage elected by each retiree. An historical premium schedule is shown below:

Type	City Paid Monthly Premium		
	12/01	12/02	12/03
Retiree Only	\$ 148.99	\$176.38	\$199.68
Retiree & Spouse	312.73	370.93	423.59

The City pays 50% of the total premium cost. Retired members pay the remaining portion (50%). Health insurance coverage terminates upon attainment of age 65.

Eighty percent of future retired members were assumed to elect 2 person coverage at retirement.

Premiums shown above were assumed to increase in future years as follows:

Year	Rate
1	9 %
2	8
3	7
4	6
5	5
6	4.5
7	4.5
8+	4.5

Effective with the December 31, 2003 valuation, a new indemnity plan option was added, and a significant number of Plan participants changed health plans. The premiums used in this valuation of the system, reflect the change in health plan utilization, and are based on a weighted average of premiums in each plan and include a factor to account for the subsidy that exists in the reported indemnity plan premiums.

DEFINITIONS OF TECHNICAL TERMS

Accrued Service. Service credited under the system which was rendered before the date of the actuarial valuation.

Actuarial Accrued Liability. The difference between the actuarial present value of system benefits and the actuarial present value of future normal costs. Also referred to as "past service liability."

Actuarial Assumptions. Estimates of future experience with respect to rates of mortality, disability, turnover, retirement, rate or rates of investment income and salary increases. Decrement assumptions (rates of mortality, disability, turnover and retirement) are generally based on past experience, often modified for projected changes in conditions. Economic assumptions (salary increases and investment income) consist of an underlying rate in an inflation-free environment plus a provision for a long-term average rate of inflation.

Actuarial Cost Method. A mathematical budgeting procedure for allocating the dollar amount of the "actuarial present value of future benefits" between future normal costs and actuarial accrued liability. Sometimes referred to as the "actuarial funding method."

Actuarial Equivalent. One series of payments is said to be actuarially equivalent to another series of payments if the two series have the same actuarial present value.

Actuarial Gain (Loss). The difference between actual unfunded actuarial accrued liabilities and anticipated unfunded actuarial accrued liabilities -- during the period between two valuation dates. It is a measurement of the difference between actual and expected experience.

Actuarial Present Value. The amount of funds currently required to provide a payment or series of payments in the future. It is determined by discounting future payments at predetermined rates of interest, and by probabilities of payment.

DEFINITIONS OF TECHNICAL TERMS

Amortization. Paying off an interest-discounted amount with periodic payments of interest and (generally) principal -- as opposed to paying it off with a lump sum payment.

Normal Cost. The portion of the actuarial present value of future benefits that is assigned to the current year by the actuarial cost method. Sometimes referred to as "current service cost."

Unfunded Actuarial Accrued Liabilities. The difference between actuarial accrued liabilities and valuation assets. Sometimes referred to as "unfunded past service liability" or "unfunded supplemental present value."

Most retirement systems have unfunded actuarial accrued liabilities. They arise each time new benefits are added and each time an actuarial loss occurs. The existence of unfunded actuarial accrued liabilities is not in itself bad, any more than a mortgage on a house is bad. Unfunded actuarial accrued liabilities do not represent a debt that is payable today. What is important is the ability to amortize the unfunded actuarial accrued liabilities and the trend in their amount (after due allowance for devaluation of the dollar).

MISCELLANEOUS AND TECHNICAL ASSUMPTIONS

Marriage Assumption:	80% of participants are assumed to be married for purposes of death and retiree health benefits. In each case the male was assumed to be 3 years older than the female.
Pay Increase Timing:	Beginning of year.
Decrement Timing:	Decrements of all types are assumed to occur mid-year.
Eligibility Testing:	Eligibility for benefits is determined based upon the age nearest birthday and service nearest whole year on the date the decrement is assumed to occur.
Benefit Service:	Exact fractional service is used to determine the amount of benefit payable.
Early Retirement Reduction:	Reduction equals six percent per year for each year Early Retirement precedes Normal Retirement.
Other:	Disability and turnover decrements do not operate during retirement eligibility.
Miscellaneous Loading Factors:	The calculated normal retirement benefits were increased by 10% to account for the inclusion of unused sick leave, vacation time, and comp. time in the calculation of Average Compensation.
Disability Assumption:	Fifty percent of disabilities were assumed to be duty related. Fifty percent were assumed to be unrelated to duty. The recovery rate from disability was assumed to be 0 (i.e., no disabled individual was assumed to recover and return to work.
Death Assumption:	Fifty percent of deaths were assumed to be duty related. Fifty percent were assumed to be unrelated to duty.
Non-forfeiture Assumption:	All vested terminated members were assumed to elect a deferred retirement benefit.
